Georgia Tech MSCS student and Software Developer Apprentice at Sony PlayStation with experience developing Java/Spring services and full-stack applications. Write unit tests, debug integration issues, and use Git and Jenkins CI/CD workflows. Bring Python data analysis and machine learning experience, with a foundation in object-oriented programming, data structures, and algorithms.

EDUCATION

Georgia Institute of Technology

Expected Dec 2027

Master of Science in Computer Science

Relevant coursework: Software Architecture and Design, Database Systems, Operating Systems, Computer Networks, Data Structures and Algorithms, Machine Learning

Techtonica | Software Engineer in Training

Sep 2025 - June 2026

- Designed, developed, tested, and debugged 6+ full-stack applications using React, JavaScript/TypeScript, Node.js, Express, PostgreSQL, REST APIs, and Jest.
- Collaborated in Agile teams to clarify requirements and deliver application features through Git pull requests, code reviews, pair programming, and testing.

SKILLS

- **Languages:** JavaScript, TypeScript, Python, Java, HTML, CSS, SQL, C#
- **Frameworks:** React, Node.js, Express, Spring Boot, REST APIs, Jest, JUnit
- **Developer Tools:** Git, GitHub, Maven, Jenkins, Docker, AWS, Jira, CI/CD
- **Databases:** PostgreSQL, MySQL, DynamoDB, Redis, pgvector

EXPERIENCE

Sony Interactive Entertainment | Software Developer Apprentice

Aug 2026 - Present

- Develop and debug Java/Spring payment services; investigate API and integration issues, implement code changes, and test payment flows to validate service behavior.
- Build a data access integration proof of concept in Java/Spring, implementing a feature flag, adaptor interface, response mapper, and unit tests while preserving existing API behavior.
- Used an AI coding agent to author 74 end-to-end payment test scenarios; ran tests in Jenkins and investigated failures involving wallet funding, payment provider configuration, and test data.
- Collaborate through Git pull requests, code reviews, Jira, and Agile workflows to validate service changes.

Georgetown University | Data Analyst

June 2023 - May 2026

- Built automated data processing and quality control pipelines to prepare biological data for ML workflows.
- Developed and evaluated ML models on 1,000+ multi-modal samples with hundreds of features, performing feature selection, model training, hyperparameter tuning, and cross validation to optimize predictive performance.
- Validated model performance using metrics including accuracy, AUC, and F1 scores.

PROJECTS

CaseForge | Node.js, React, TypeScript, PostgreSQL, BullMQ, Redis, Gemini

- Built a full-stack research platform with a React/TypeScript frontend, Node.js REST APIs, and PostgreSQL to help users collect publications and prepare immigration petition evidence.
- Implemented asynchronous citation retrieval using BullMQ and Redis, allowing background processing without blocking application requests.
- Integrated Clerk authentication and protected workflows to control access to user-specific application data.
- Containerized application services with Docker Compose for reproducible local development and consistent environments.

Tails & Tales | React, Express, PostgreSQL, pgvector

- Developed a full-stack pet journaling application using React, Express, and PostgreSQL; implemented semantic search with MiniLM embeddings, pgvector, and cosine similarity.
- Integrated LLM-powered title generation and translation features to enhance the journaling experience.
